BULBS TO PLANT IN THE SPRING

By E. I. FARRINGTON.

May is an excellent month for planting the summer and fall flowering bulbs. The list of these bulbs is much longer than the average garden maker realizes. Everybody is familiar with came, with no trouble with bugs. gladioli and dahlias, the latter commonly being considered as bulbs although they are really tubers. Comparatively few amateurs, though, are at all familiar with the montbretias, and yet they are exceedingly satisfactory and cost but little. While the flowers resemble gladiolus blossoms to some extent, they are smaller. Moreover, they throw up one spray after another for weeks. The colors are mostly reds and yellows in different shades, and give a splendid note to the garden in the fall of the year. Of course a few bulbs planted alone would make but a meagre showing, but when they are used in masses the result is surprisingly fine. They are excellent flowers to use in the border to fill in spaces left vacant by early blooming plants like the irises and the peonles. birth of Christ, and the flowers were Use them by the dozen, setting the little bulbs about four inches apart and two inches deep. Few flowers are Shakespeare, Milton, Wordsworth, more desirable for cutting, as they last a long while. Although the stems are slender they are strong, and the sprays In England the narcissus was a pop-In place of Chinese lilles seedsmen ular garden flower at a very early little Japanese bowls which are now date. Gerard in his "Herbal," 1597. are well adapted for displaying in the popular. There isn't the variety that gives a list of narcissi in cultivation at that time. Parkinson in his work in 1629, Miller in 1739 and other early several new shades are being put on English gardening authorities give exthe market and the blossoms are larger than the older sorts. One landcellent illustrations and descriptions scape architect with whom the writer s acquainted says that in his own Daffodils attracted only ordinary atgarden the montbretias have given the tention until about 1884, when, due to the efforts of enterprising British greatest satisfaction of all his fail florists, headed by Peter Barr, daffo-

lowering plants. Tigridias are not worth growing so freely as the montbretias, but they are exceedingly showy, and a few of them add much to the charm of the garden Tigridias are often called shell flowers, and the large blossoms are among the most brilliant of all bulbous blooms. Tazetta, carry from six to twelve Unfortunately, though, they last for blooms on a stem and are sweet scented. Being natives of mild climates, they are not hardy and can montbretia bulbs are reasonably hardy parently without reason. anthus narcissi flourish. The Paper White and Danube Roman are first

one not often seen in gardens, is the Wood ashes are also good to use in Peruvian daffodil, often catalogued as Ismene calathina. This is a chaste, lily-like flower, which may be grown in pots indoors in winter or in the garden border in summer. It somewhat resembles the Easter lily except that it has several curious prongs extending beyond the blossoms, creating a very unusual effect. The Peruvian daffodil is exceedingly fragrant. A few flowers will fill a whole garden with perfume, especially at night. Wait until settled warm weather has come before you plant out the bulbs and take them up in the fall. No special culture is needed during the grow ing season, and the bulbs will flower even in partial shade. A few of them make a most welcome addition to any garden, whether it be large or small.

In the last few years increasing at-Choice varieties that are to be saved tention has been given to the beautiful are grown on in a cooler temperature, plant known as Hail's Amaryllis, often catalogued as Lycoris. This is a bulbripened, then the pots are turned on ous plant, but one which is perfectly their sides, water is withheld and in about a month the bulbs are removed hardy. It has a curious habit of from the soil, the roots and leaves growth, however, and one which may cut off and the bulbs stored in a cool cause the amateur to suffer the loss of place until July, when they are set out the plant unless he is familiar with its in the open ground. In a year or two eccentricities. It comes up not unlike the bulbs are taken up and potted a German iris in the spring, but in again for winter flowering. Protection July the foliage entirely disappears is afforded against freezing in winter. Apparently the plant is dead, and that is too often the verdict of the novice. Try planting the bulbs in good soil, in fair sized pots, growing them on. In August or September, however, if the bulb has not been disturbed, sevwithout disturbing, for a second year. If successful keep them in the same eral flower stalks suddenly shoot up and produce splendid lilly-like flowers In the case of rare species use pink in color and delicately perfumed rather small pots at the start and So attractive are the blossoms that one shift into larger pots without breaking leading seedsman has used them for the ball of earth of the first pot and the cover design on his annual catalogue. In order to have a worthwhile . After the plants have flowered place effect a dozen bulbs should be used in the pots in a cold frame or other cool a group, setting them six inches apart, place, free from frost and where there. The flowers look rather strange on is sufficient light, until the leaves die their swaying stalks, totally destitute down. The pots may then be laid on of foliage, and for that reason it may their sides for a month or six weeks be well to have some low growing

They were put into my bublication that a moth ball pushed publication that a moth ball pushed Soon after I sprayed with pyrox. At bed on reaching home or were left in the dew over night and set out early

the next morning.

My most wonderful find was the maidenhair fern on its long black glistening stem. These I found among the rocks on the hillsides in the woods' deepest recesses. After planting the ferns I threw over the bed all the moss, wood fibre and earth left in the baskets and some leaf earth which I made by packing in a cement bin all the fall leaves, lawn rakings and yard refuse the only cost was the amount paid and placing boards over the top, allowing it to decay.

I kept the bed well watered, and in little while it looked like a consolidated wood nook, only lacking the beautiful wood surroundings.

Each spring as soon as the earth is firm enough to walk on I set out with basket and trowel to add to my collection. The overflow from the bed went on to a bank by the side of the road where nothing but grass would grow. After top dressing with leaf earth and manure the wild flowers, ferns and yellow lilles have grown in rank profusion and the bank rivalled the bed Lately I have been fortunate in buying wheelbarrowful of half wild column bine of many colors and combinations. dreds of seedlings to add even greater beauty to the flower bed and the bank

PLANT ENOUGH SEED CORN.

The advice to "Plant one ker- aired. nel for the blackbird, one for the the particular usefulness of the plants, crow, one for the cutworm and two B denotes plants that are especially ever. It is never advisable to plant estrable for borders; C those suitable weak seed, and it is the height of for carpet bedding; E low growing folly to attempt to atone for the plants good for edging; R plants that weakness of the seed by planting a lo well in rockeries; W good plants superabundance, as, irrespective of other conditions, weak seed will produce only low yielding plants. For Æthionema grandiflora, rose pink, 24. good harvests it is essential to plant vigorous seed of acclimated and well known varieties. Experts of the United States Department of Agriculture recommend planting the best quality seed a little thicker than the stand desired in order to provide against unfavorable conditions. these unfavorable conditions do not arise, it is easier to remove a few stalks from the growing crop than it is to replant, which always produces late maturing, unprofitable plants. Plant sufficient seed to secure a good stand, as it is more practicable and profitable to thin a thick stand of corn than to replant a patchy! spotted field. With good seed and good soil conditions, about four kernels should be planted for every three

PLANTING TOO THICK DISAP-POINTS.

The home gardener who sows too Next week a list of perennials will thickly and allows the plants to grow without thinning will be disappointed in his crop. Thinning permits selection by discarding the weak inferior plants, and provides a uniform stand. When reot crops are planted too thickly the roots never develop to a good size, causing a low yield and a poor quality. When other crops are planted thickly they choke each other and none of the plants will develop A thick seeding when not followed by thinning has the same effect as allowing weeds to grow in the row, is the way the matter is stated at the New York State Col-

lege of Agriculture. The early root crops, such as bunch onions, beets, turnips, carrots and radishes can sometimes be thinned as used by removing the largest for table use and allowing the smaller to mature. Leaf lettuce, spinach, or chard, if not very thick, also can be thinned as used by removing plants all along the row and not all from the same

The individual plants do not require much spade at first, but must be given room as they become larger. For best results on most garden soils the common crops should have quire shading at this season. Do not the following distances between plants when they are nearly mature: Green shading has been tried, and tuce (leaf), 6 inches (head, 8 to 10 while it may look well from the out- inches); radish, 2 inches; turnip, (dry, 3 to 6 Inches); spinach, 6 inches; slacked lime mixed with sour milk, chard, 8 inches; tomatoes, 24 to 36
